The only truly effective and lasting action to take, in preventing Asian carp, and other invasive species, from transferring between the Great Lakes and Mississippi River watersheds, is complete, physical separation of the two systems, as they originally were. The integrity of each unique ecosystem, and billions of dollars in economic assets and activity are at stake, and time is critical, as other attempts at mitigation have been unsuccessful and/or incomplete. Once the carp are in the Great Lakes, their removal will be impossible, and millions will have to be spent, annually, to address their damage--some industries may not survive the impacts of the carp. Complete separation is imperative, warranted, and mandated by the facts and current conditions.
