To Whom It May Concern:

The Asian Carp, an invasive species of fish that are moving into the Great Lakes, will inflict great damage to the Great Lakes ecosystem. Because they can eat enormous amounts of food and because they can grow to be four feet long and 100 pounds, they will surely become the most dominant species if the problem is left neglected.

The Asian Carp problem demands attention. Multiple, highly efficient electric fish barriers should be placed along the canals connecting the Great Lakes to ensure that Asian Carp will stay away from the Lakes. Also, commercial, civilian, and state harvesting will be enacted. To ensure the well-being of the other lake life, no harmful chemicals should be placed into the water.

Sincerely

Brett Graves
